

that they both have predators and prey but have different
issues like different kinds of pollution and get affected
all because of us humans. In aquatic habitats there is
water pollution. In terrestrial habitats there is air pollution,
climate change and deforestation. Some animals have different
adaptations like in the water fish have gills to
breathe but mammals on land have lungs to breathe.
Underwater fish have streamlined bodies to move swiftly
while mammals on land have special hooves and
paws some to move swiftly and some to run
fast.
