Science Retest

Chapter - 8

i

1. d) Node.

2. c) Eye.

3. c) long and ridged seeds.

4. b) Pistil.

ii

5. Unisexual.

6. Reproductive.

7. zygote.

8. vegetative parts.

iii

9. iii) Maple.

10. i) Leaf.

11. iv) Stigma.

12. ii) Fungi.

13. The pollen grains from the anther, move to the pistil of a flower, it is called as pollination. There are two types of pollination. That are:

* Self-pollination.

* Cross-pollination.

14. Vegetative propagation is an asexual reproduction. Plants grow in the vegetative parts of a plant like roots, stem, leaf, and bud.

15.	Asexual Reproduction	Sexual Reproduction
	When a plant is grown without seed, it is known as asexual reproduction.	When a plant is grown with the help of seed, it is known as sexual reproduction.

16. Due to some chemical reaction flowers produce nectar and have bright colors.

17. First, a flower gets formed in a plant. Then, the ~~plant~~ flower receives a pollen. In some day, it forms a fruit.

18. From the anther, pollen grains move through air, that is male gametes. ~~It~~ In another flower, the pistil contains stamen, style and ovary. In ovary, one or more eggs ~~get~~ or female gametes get formed. When male and female gamete gets fused it forms a zygote.
